

PRINTED CIRCUIT ENGINEERING PROFESSIONAL

Table of Contents

SEC CHAPTER 1 Professional Overview

Introduction

- 1.1 Printed Circuit Engineering Layout Overview – Profession overview
- 1.2 Basic Fabrication of a Printed Circuit Board – Materials and construction
- 1.3 Basic Assembly of a Printed Circuit Board – Materials and process
- 1.4 Basic Electronics in a PCB – Fundamental understanding and concepts
- 1.5 Basic Printed Circuit Engineering Layout Overview – Layout process
- 1.6 Project Management (PM) – Enabling project success and accountability
- 1.7 Communication – The value all throughout the process

SEC CHAPTER 2 Circuit Definition and Capture

- 2.1 Libraries to Bill of Material (BOM) – Integ. library: symbols, land patterns
- 2.2 Surface Mount and Thru-Hole Technology – Components and process
- 2.3 Schematic Types and Conventions – Parameters and conventions
- 2.4 Schematic Symbol Placement – Orderly circuits improve comprehension
- 2.5 Schematic Review – Complete and accurate
- 2.6 Circuit Board Types – Rigid, Flex and Printed Electronics
- 2.7 IPC - MIL Standards and Specifications – Reference listing of standards
- 2.8 Verification, Testing, Compliance & Qual. Assurance – Accuracy
- 2.9 Mechanical Board Information – Physical requirements
- 2.10 Database Links and Iterative Data Exchange – Development iterations

SEC CHAPTER 3 Board Layout Data and Placement

- 3.1 Set Up Board Parameters – CAD - Working environment
- 3.2 Stackup Design – Z-Axis relationship
- 3.3 Constraints and Rules – Define and implement accurate reliability
- 3.4 Placement for Assembly – Performance and buildability
- 3.5 Placement of Components – Solvability, performance and manufacturing
- 3.6 Schematic Driven Placement – Integrated cross-probing
- 3.7 Placement Dense Digital Circuits – Large Scale Integration
- 3.8 Placement Power Delivery – Source, Distribution and Usage
- 3.9 Placement Mixed Circuit (RF/HSD) – Independently together
- 3.10 Placement Review Milestone – Approval to proceed into routing

SEC CHAPTER 4 Circuit Routing and Interconnection

- 4.1 General Overview of Routing – Fundamental parameters
- 4.2 Routing Dense Digital Circuits – Modular approach
- 4.3 Routing with Signal Integrity Applications – Managing energy fields
- 4.4 Routing Power Delivery – Source, Distribution and Usage
- 4.5 Routing RF Circuits – Managing Dissipation and Loss
- 4.6 Routing Review Milestone – Approval to proceed into routing

SEC CHAPTER 5 Flex Printed Circuits (FPC)

- 5.1 Flex and Rigid-Flex Technology – Overview and Introductions to FPC
- 5.2 Flexible Printed Circuit Types – IPC established definition
- 5.3 Flexible Circuits Applications – Industry sectors and usage
- 5.4 Materials for Flexible Circuits – Properties and process
- 5.5 Design Start Considerations – Physical and electrical overview
- 5.6 FPC Stack-up Constructions – Usage and process
- 5.7 Flex Design Practices – Physical and electrical aspects
- 5.8 Production Process Consideration – Process flow overview
- 5.9 Conductive Surface Finishes – Overview of types and process
- 5.10 Stiffeners – Types and applications
- 5.11 Shielding Material – EMI and EMC considerations
- 5.12 Design for Fabrication & Assembly – Unique concerns building FPC

SEC CHAPTER 6 Documentation and Manufacturing Preparation

- 6.1 Documentation Overview – Prepare for the final design effort
- 6.2 Resequencing Reference Designators – Back-annotation
- 6.3 Silkscreen – Providing visual intelligence
- 6.4 Industry Standards – Design, document and build compliance
- 6.5 Post-processing Procedure – Know what to expect at your company
- 6.6 Manufacturing Deliverables – Documentation overview
- 6.7 Fabrication Drawing – Instructions to fabricate the bare board
- 6.8 Assembly Drawing – Reference drawing used to assemble the PCA
- 6.9 Schematic Database and Drawing – Circuit capture and BOM origin
- 6.10 Bill of Materials (BOM) – Controlling document
- 6.11 Final Deliverables – Formats and creation process
- 6.12 Transfer to Manufacturer – Manufacturing interface

During the review class, cursory coverage of the material in this section due to the in-depth nature of this subject.

SEC CHAPTER 7 Advanced Electronics, EM Applications

- 7.1 Energy Movement in Circuits – Introductory overview of EM Theory
- 7.2 Critical Frequencies in Circuits on PC Boards – Frequency and Rise Time (Tr)
- 7.3 Transmission Lines in PC Boards – Relational nature in electronics
- 7.4 Understanding Impedance of Transmission Lines – Modification from layout
- 7.5 Impedance Control of Transmission Lines – Controlling impedance in layout
- 7.6 Controlling Impedance of Digital ICs – Controlled and set to specific values
- 7.7 Controlling Noise Margin – Critical lengths understanding
- 7.8 Crosstalk and Cross-coupling – Capacitive and inductive coupling
- 7.9 Controlling Timing of High Speed Lines – Timing matched, not length
